Event Overview

As more and more data has confirmed that the Arctic is extremely rich in oil and gas reserves, locations such as Greenland and the Barents Sea have seen a huge growth in interest from the hydrocarbon industry. Upcoming licensing rounds in Greenland, and the Barents Sea Russia – Norway maritime border agreement have increased the attention of operators to these locations.

However, there are many challenges in this area that may hamper operations. The presence of cold temperatures, ice and a relative lack of infrastructure pose logistical problems that make exploration expensive. Moreover, the pristine arctic environment and local communities used to traditional ways of life are more vulnerable. Many topics need to be addressed with regards to also safety, health and sustainability. The treasures of the Arctic are there, but there is much to be done in the future, in order to commercialise them.

This 2nd annual **marcus evans** forum brings the newest, most relevant information, focusing on the Arctic's hottest regions to deliver lessons valid throughout.
